

Question 1 – JSONPlaceholder Users → Class Objects

Create a class User that stores data fetched from <https://jsonplaceholder.typicode.com/users>.

Requirements:

1. The constructor (`__init__`) should accept id, name, and email.
2. Define a method `showUser()` to print the user details in a readable format.
 - Example: User #1 → Leanne Graham (Sincere@april.biz)
3. Define another method `getEmailDomain()` to return only the domain part of the email.
 - Example: april.biz
4. Fetch users from the API and create **multiple User objects**.
5. Print details of at least **5 users** using `showUser()` and `getEmailDomain()`.

```
import requests

apiUrl="https://jsonplaceholder.typicode.com/users"

res=requests.get(apiUrl)

class jsondata:

    def __init__(self,id,name,email):

        self.id=id

        self.name=name

        self.email=email

        # print(self.id)

    def showuser(self):

        pass

        # print(f"user #{self.id} ----> {self.name} ({self.email})")

    def getemaildomain(self):

        a=self.email

        b=a.split('@')

        print(b[1])

if res.status_code==200:
```

```
data=res.json()

for i in data:

    id_i = i["id"]

    name_i = i["name"]

    email_i = i["email"]

    abc=jsondata(id_i,name_i,email_i)

    abc.showuser()

    abc.getemaildomain()
```

o/p:

user #1 ----> Leanne Graham (Sincere@april.biz)

april.biz

user #2 ----> Ervin Howell (Shanna@melissa.tv)

melissa.tv

user #3 ----> Clementine Bauch (Nathan@yesenia.net)

yesenia.net

user #4 ----> Patricia Lebsack (Julianne.OConner@kory.org)

kory.org

user #5 ----> Chelsey Dietrich (Lucio_Hettinger@annie.ca)

annie.ca

user #6 ----> Mrs. Dennis Schulist (Karley_Dach@jasper.info)

jasper.info

user #7 ----> Kurtis Weissnat (Telly.Hoeger@billy.biz)

billy.biz

user #8 ----> Nicholas Runolfsdottir V (Sherwood@rosamond.me)

rosamond.me

user #9 ----> Glenna Reichert (Chaim_McDermott@dana.io)

dana.io

user #10 ----> Clementina DuBuque (Rey.Padberg@karina.biz)

karina.biz

Question 2 – JSONPlaceholder Posts → Blog System

Create a class Post to manage blog posts fetched from <https://jsonplaceholder.typicode.com/posts>.

Requirements:

1. The constructor should accept `userId`, `id`, `title`, and `body`.
2. Define a method `showSummary()` that prints the post ID and first 20 characters of the title. ○
Example: Post #1 → sunt aut facere repellat...
3. Define another method `getWordCount()` that counts how many words are in the body.
4. Fetch posts from the API and create **multiple Post objects**.
5. For the first **3 posts**, show summary and word count.

```
import requests
```

```
apiUrl="https://jsonplaceholder.typicode.com/posts"
```

```
res=requests.get(apiUrl)
```

```
class jsondata:
```

```
    def __init__(self,userId,id,title,body):
```

```
        self.userId=userId
```

```
        self.id=id
```

```
        self.title=title
```

```
        self.body=body
```

```
        # print(self.id)
```

```
    def showsummary(self):
```

```
        ti=self.title[0:20]
```

```
        print(f"Post #{self.id} ----> {ti}.....")
```

```

def getWordCount(self):

    b = self.body

    a = b.split(" ")

    # print(a)

    # count=" "

    count=0

    for j in a:

        # print(j[0])

        count+=1

    print(count)

    # print(self.body)

if res.status_code==200:

    data=res.json()

    for i in data[0:3]:

        userid_i = i["userId"]

        id_i = i["id"]

        title_i = i["title"]

        body_i= i["body"]

        abc=jsondata(userid_i,id_i,title_i,body_i)

        abc.showsummary()

        abc.getWordCount()

```

o/p:

Post #1 ----> sunt aut facere repe.....

Post #2 ----> qui est esse.....

28

Post #3 ----> ea molestias quasi e.....

23

Question 3 – DummyJSON Products → Flipkart Style

Use API: <https://dummyjson.com/products>

Create a class Product to store details of each product.

Requirements:

1. The constructor should accept id, title, price, and stock.
2. Define a method showDetails() to display product info.
 - Example: Laptop (₹50000) – Stock: 12
3. Define another method buyProduct(qty) that reduces stock if enough stock is available, otherwise print "Out of stock".
4. Fetch product data from API and create **multiple Product objects**.
5. Simulate a shopping cart by buying:
 - 2 units of the first product.
 - 1 unit of the second product.
 - Try buying more than stock for the third product.
