

Multiple Inheritance in Uber

1. Create Parent Class 1 → Person

o Attributes: name, contact.

o Example values: "Rahul", "9876543210".

2. Create Parent Class 2 → Driver

o Attributes: license_no, rating.

o Example values: "DLX12345", 4.9.

3. Create Child Class → UberDriver (inherits from Person + Driver)

o Extra Attribute: car.

o Example value: "Hyundai i20".

4. Constructor & Data Passing

o When creating an UberDriver object, pass all attributes:

▪ name, contact (for Person)

▪ license_no, rating (for Driver)

▪ car (for UberDriver).

5. Object Creation Example

6. d1 = UberDriver("Rahul", "9876543210", "DLX12345", 4.9, "Hyundai i20")

7. Display Details

o Calling a method like d1.show() should print:

o Name: Rahul, Contact: 9876543210

o License No: DLX12345, Rating: 4.9

Car: Hyundai i20

EXAMPLE:

```
class person:
```

```
    def __init__(self):
```

```
        pass
```

```
def show(self,name,contact):  
    print("UBER DRIVER DETAILS")  
    print(f"name:{name}")  
    print(f"contact:{contact}")
```

```
class driver:
```

```
    def __init__(self):  
        pass
```

```
    def showdriver(self,license_no,rating,car):  
        print(f"licence no:{license_no}")  
        print(f"rating:{rating}")  
        print(f"car:{car}")
```

```
class uberdriver(person,driver):
```

```
    def __init__(self,name,contact,license_no,rating,car):  
  
        person.show(self,name,contact)  
        driver.showdriver(self,license_no,rating,car)
```

```
d1=uberdriver("Rahul","9876543210","DLX12345",4.9,"Hyundai i20")
```

output:

UBER DRIVER DETAILS

name:Rahul

contact:9876543210

licence no:DLX12345

rating:4.9

car:Hyundai i20

1. Create Parent Class 1 → Person

o Attributes: name, contact.

o Example values: "Anil", "9876543210".

2. Create Parent Class 2 → Employee

o Attributes: emp_id, salary.

o Example values: "BKP101", 12000.

3. Create Child Class → DeliveryPartner (inherits from Person + Employee)

o Extra Attribute: vehicle.

o Example value: "Scooter".

4. Constructor & Data Passing

o When creating a DeliveryPartner object, pass all attributes:

▪ name, contact (from Person)

▪ emp_id, salary (from Employee)

▪ vehicle (from DeliveryPartner).

5. Object Creation Example

6. dp1 = DeliveryPartner("Anil", "9876543210", "BKP101", 12000, "Scooter")

7. Display Details

o Calling dp1.show() should print:

o Name: Anil, Contact: 9876543210

o Employee ID: BKP101, Salary: 12000

Vehicle: Scooter

EXAMPLE:

class person:

```
def __init__(self):  
    pass
```

```
def show(self,name,contact):  
    print("EMPLOYEE DETAILS")  
    print(f"name:{name}")  
    print(f"contact:{contact}")
```

```
class employee:
    def __init__(self):
        pass

    def showdriver(self,emp_id,salary,vehical):
        print(f"employee id:{emp_id}")
        print(f"salary:{salary}")
        print(f"vehical:{vehical}")
class deliveryPartner(person,employee):
    def __init__(self,name,contact,emp_id,salary,vehical):

        person.show(self,name,contact)
        employee.showdriver(self,emp_id,salary,vehical)
dp1=deliveryPartner("Anil", "9876543210", "BKP101", 12000, "Scooter")
```

OUTPUT:

EMPLOYEE DETAILS

name:Anil

contact:9876543210

employee id:BKP101

salary:12000

vehical:Scooter
