

1. Fetch all posts and print the **total number of posts** returned

```
import requests

apiUrl="https://jsonplaceholder.typicode.com/posts?utm_source=chatgpt.com"

res=requests.get(apiUrl)

if res.status_code==200:

    content=res.json()

    print(len(content))
```

o/p: 100

2. Fetch the post with **id = 15** and print its title only.

```
import requests

apiUrl="https://jsonplaceholder.typicode.com/posts?utm_source=chatgpt.com"

res=requests.get(apiUrl)

if res.status_code==200:

    content=res.json()

    # print(content,"content of the url")

    for i in content:

        if i["id"]==15:

            print(i["title"])
```

o/p:

eveniet quod temporibus

3. Fetch all posts where **userId = 3** and print the count of those posts.

```
import requests

apiUrl="https://jsonplaceholder.typicode.com/posts?utm_source=chatgpt.com"

res=requests.get(apiUrl)

if res.status_code==200:

    content=res.json()

    # print(content,"content of the url")

    for i in content:

        if i["userId"]==3:
```

```
print(len(i))
```

o/p:10

4. Fetch the post with **id = 50** and print both title and body

```
import requests
```

```
apiUrl="https://jsonplaceholder.typicode.com/posts?utm_source=chatgpt.com"
```

```
res=requests.get(apiUrl)
```

```
if res.status_code==200:
```

```
    content=res.json()
```

```
    # print(content,"content of the url")
```

```
    for i in content:
```

```
        if i["id"]==50:
```

```
            print(i["title"],i["body"])
```

API2

1.Count all users

Task: Fetch all users and print the **total number of users** returned.

```

import requests
apiUrl="https://jsonplaceholder.typicode.com/users"
res=requests.get(apiUrl)
if res.status_code==200:
    content=res.json()
    # print(content,"content of the url")
    print(len(content))

```

o/p:10

Get a user by ID

2. *Task:* Retrieve the user with id = 5 and print their **name** and **email**.

for i in content:

```
    if i["id"]==5:
        print("name:",i["name"],"email:",i["email"])
o/p: name: Chelsey Dietrich email: Lucio\_Hettinger@annie.ca
```

3.Filter users by username

Task: Fetch user(s) with username = "Bret" and print the entire JSON object for the match.

```
import requests
apiUrl="https://jsonplaceholder.typicode.com/users"
res=requests.get(apiUrl)
if res.status_code==200:
    content=res.json()
    # print(content,"content of the url")
    # print(len(content))
    for i in content:
        if i["username"]=="Bret":
            print(i)
```

o/p:

```
{'id': 1, 'name': 'Leanne Graham', 'username': 'Bret', 'email':
'Sincere@april.biz', 'address': {'street': 'Kulas Light', 'suite': 'Apt. 556', 'city':
'Gwenborough', 'zipcode': '92998-3874', 'geo': {'lat': '-37.3159', 'lng':
'81.1496'}}, 'phone': '1-770-736-8031 x56442', 'website': 'hildegard.org',
'company': {'name': 'Romaguera-Crona', 'catchPhrase': 'Multi-layered client-
server neural-net', 'bs': 'harness real-time e-markets'}}
```

4. Search users by city in address

Task: Retrieve all users and print the names of those whose address.city is "South Christy".

```
for i in content:
    if i["address"]["city"]=="South Christy":
        print(i["name"])
```

o/p: Mrs. Dennis Schulist

5. List user IDs by company name

Task: Fetch all users and print the id of each user whose company.name contains the word "Group".

```
for i in content:
    if "Group" in i["company"]["name"]:
        print(i["id"])
```

o/p: 7

8

API 3:

1.Count all todos

Task: Send a GET request to /todos and print the **total number of todo items** returned.

```
import requests
apiUrl="https://jsonplaceholder.typicode.com/todos"
res=requests.get(apiUrl)
if res.status_code==200:
    content=res.json()
    # print(content,"content of the url")
    print(len(content))
o/p:200
```

2. Get a specific todo by ID

Task: Use a GET request to fetch the todo with id = 42 and print its title.

for i in content:

```
    if i["id"]== 42:
        print(i["title"])
```

o/p: rerum perferendis error quia ut eveniet

3. Filter todos by userId

Task: Send a GET request with userId=3 (e.g., ?userId=3) and print how many todos belong to that user.

for i in content:

```
    if i["userId"]== 3:
        print(i["id"])
```

o/p: 41
